

We have redesigned the reminder devices, both to reduce their environmental impact and to replace the sticky black magnetic tape.

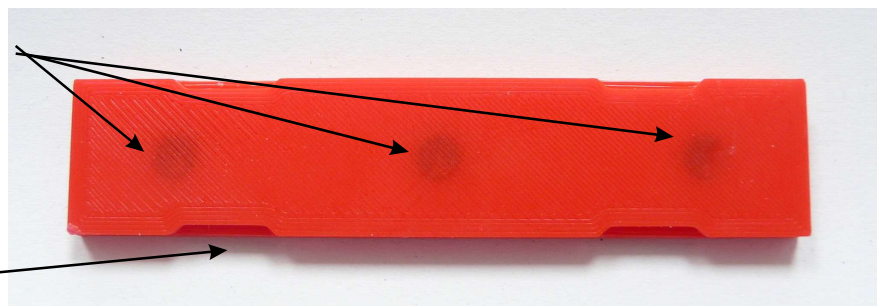

We now 3D print devices using PLA plastic, which is a biodegradable plastic made from corn starch or sugarcane. 3D printing vastly reduces plastic waste caused when devices are machined or cut from solid material. PLA plastic is biodegradable, but don't worry it is still strong, for it to degrade it needs heat and moisture. 3D printing also gets rid of most of any Minimum Order Quantities because all the work can be done 'in-house'.

For devices that need to be magnetic we have replaced the black sticky magnetic tape and have instead embedded strong neodymium magnets within the devices. Again this reduces waste as we don't have to cut shapes from the black tape. We can make the magnets as strong as required by increasing or reducing the number of embedded magnets.

The magnets aren't just stuck in the bottom of the device, they are embedded inside it, so we don't rely on glue to keep them in place.

Embedded magnets

Finger grip gaps

And for those of us with 'less than skinny' fingers, we added, or maybe that should be removed, finger grip holes on the underside of the devices.

We haven't printed all versions yet, so some of the pictures shown will still be the old versions. We have included them so that you can still find part numbers.

If there is a size, shape, colour or type of device that isn't shown, contact us, the answer is probably 'yes' we can design and make that for you.

If you need particular magnetic orientation, again contact us, we can send you marked devices to help you select the correct type.
